PRICE & DELIVERY ONLINE AT WWW.MAINFILTER.COM

Featured Product

If you have worked with hydraulic equipment for any length of time, it's likely that you've come across a hydraulic system with cloudy oil. Oil becomes cloudy when it is contaminated with water above its saturation level. The saturation level is the amount of water that can dissolve in the oil's molecular chemistry and is typically 200 - 300 ppm at 68°F (20°C) for mineral hydraulic oil. Note that if hydraulic oil is cloudy it indicates that a minimum of 200 - 300 ppm of water is present.

Main Filter manufactures a complete line of hydraulic and lube oil filters, but did you know we can also build most of these filters with our water removal media. We co-pleat our particulate removal media with the water removal media, to ensure a filtration value while the water removal filter is in use. We offer these filters at a variety of nominal and absolute micron ratings. Please contact our sales department for more information.

Holiday Hours - www.mainfilter.com

Main Filter will be open Monday May 18th, 2009 (Canadian Holiday – Victoria Day) with our regular hours of 8am to 5pm EST.
